What did I found from this run ?

All numbers are from the 577-image test set, which the model never trained on. The notebook produced the ranges (95% bootstrap confidence intervals).

Task	Result
Eye left / right	99.65% accuracy (99.1 – 100%); 2 errors out of 577
Image centre (macula / optic disc)	93.6% accuracy, but balanced accuracy 84.4% (76.4 – 91.9%); optic-disc recall 74% (23 of 31)
DR grade 0 – 4	70.0% accuracy (66.1 – 73.9%), QWK 0.890 (0.869 – 0.909)
Referable DR (grade 2 or higher)	88.1% sensitivity, 93.3% specificity

Report the centre result as balanced accuracy, not 93.6%, because only about 5% of images are optic-disc centred. Example outputs from your own run, in your supervisor's format:

dc0f6e5b489b.png Eye: right 99.9% Centre: macula 96.1% DR: Grade 0 (No DR) 99.9%
4ed31cc07366.png Eye: right 100% Centre: macula 91.8% DR: Grade 2 (Moderate) 37.0% -> needs review

On confidence: among test predictions with ⩾95% grade confidence (256 images), the model was right 98.0% of the time. Calibration cut the grade confidence error (ECE, where lower is better) from 8.3 to 4.9 points.
